Current Program of Research

My program of research investigates schizotypy and schizophrenia from both experimental and developmental psychopathology perspectives. My research focuses on developing and testing symptom, personality, neurocognitive, biobehavioral, and genetic markers of schizotypy. This program of research traces its roots back to Paul Meehl's landmark work on schizophrenia and schizotypy and to the pioneering work on psychosis proneness by the Chapmans. It is guided by two primary questions: *How can we identify individuals who are at risk for schizophrenia and related disorders, and how will identifying individuals at risk help us better understand the etiology, phenomenology, course, and treatment of these disorders?* My research is based upon the theory that there are schizophrenia-prone, or "schizotypic," individuals who have a vulnerability for schizophrenia. It is hypothesized that this vulnerability arises from a process of "neuromaldevelopment" that results from the interaction or accumulation of multiple genetic, biological, and environmental risk factors. It is further hypothesized that schizotypy is expressed across a dynamic continuum of adjustment. The majority of schizotypic individuals are not expected to decompensate, although they may demonstrate mild or transient forms of the experiences and symptoms reported in schizophrenic patients—and this impairment provides useful points of entry for identifying schizotypic individuals. The reliable identification of schizotypes should facilitate discovery and understanding of etiological factors, provide a unique window for examining risk and resilience factors related to the development of schizophrenia-spectrum disorders, and may ultimately hasten the development of prophylactic treatment interventions. A secondary, but related, focus of my research laboratory examines bipolar spectrum psychopathology, and specifically clinical and subclinical manifestations of hyperthymic traits. My research in this area builds upon previous longitudinal findings that my colleagues and I published examining vulnerability for bipolar disorders in hyperthymic young adults.

My research into these topics is both theory driven and programmatic. It entails prospective studies as well as cross-sectional assessments that are appropriate for student researchers. As detailed below, my program of research integrates theory and methods from multiple domains of inquiry and from multiple scientific disciplines (e.g., clinical, developmental, and cognitive psychology, cognitive neuroscience, psychiatry, and behavioral and molecular genetics). My laboratory is currently conducting research in three interrelated areas, including: 1) Expression of Clinical and Subclinical Psychopathology in Daily Life using Experience Sampling Methodology, 2) Identification and Assessment of the Multidimensional Structure of Schizotypy, and 3) Assessment of Biobehavioral Markers of Risk for Schizophrenia. Although these projects differ in terms of methods and participants, they are focused on refining our identification of schizotypic individuals and our understanding of etiological factors relevant to the development of schizophrenia and related conditions.
